
MEMO

Kepada : Semua Kakitangan PPAS

Bil. Fail : Bil () PA

Perkara : MAKLUMAN TENTANG 'CRITICAL VULNERABILITY IN WINDOWS,

Dengan hormatnya saya diarah merujuk kepada perkara di atas.

2. Adalah dimaklumkan bahawa, Bahagian Teknologi Maklumat memperolehi maklumat dari Mycert Malaysia. Sumber dipetik seperti berikut:-

'A critical vulnerability (CVE-2010-2568) has been identified in the Microsoft Windows that executes code specified in shortcut files (.LNK). The vulnerability, if successfully exploited could potentially allow an attacker to execute arbitrary code with the privileges of the user on the affected system. The vulnerability exists because Windows incorrectly parses shortcuts in such a way that malicious code may be executed when the user clicks the displayed icon of a specially crafted shortcut. Essentially, this vulnerability is most likely to be exploited through removable drives. For systems that have AutoPlay disabled, customers would need to manually browse to the root folder of the removable disk in order for the vulnerability to be exploited'. 'An attacker who successfully exploits this vulnerability will be able to execute arbitrary codes remotely and take control of the affected system'.

3. Oleh itu BTM meminta kerjasama semua kakitangan PPAS yang menggunakan produk Windows untuk tidak membatalkan proses kemaskini 'auto-update' di komputer anda.

Sekian, terima kasih
